Introduction

- One approach to reducing cyber security risk involves security compliance.
 - Require that the enterprise comply with well-defined security rules, policies, procedures, and practices.
- Compliance is about guiding good security decisions in an enterprise.

How compliance can reduce APTs for example

- Let's suppose an organization decides to include the following 5 requirements in their compliance program:
 - Email filtering
 - Employee awareness
 - Enterprise scanning
 - PC Security
 - URL filtering

How compliance can reduce APTs for example cont.

- Each requirement targets one component step in a typical APT attack path. Illustrate (5 Marks)

Problems with compliance

- Inconsistencies of different frameworks.
- Sometimes not for security for example just to inventory assets.
- Are sometimes redundant especially if created in response to an attack as a form of punishment.

Compliance Frameworks

- Consider NIST's security compliance framework called the Framework for improving critical infrastructure cyber security (10 Marks)
